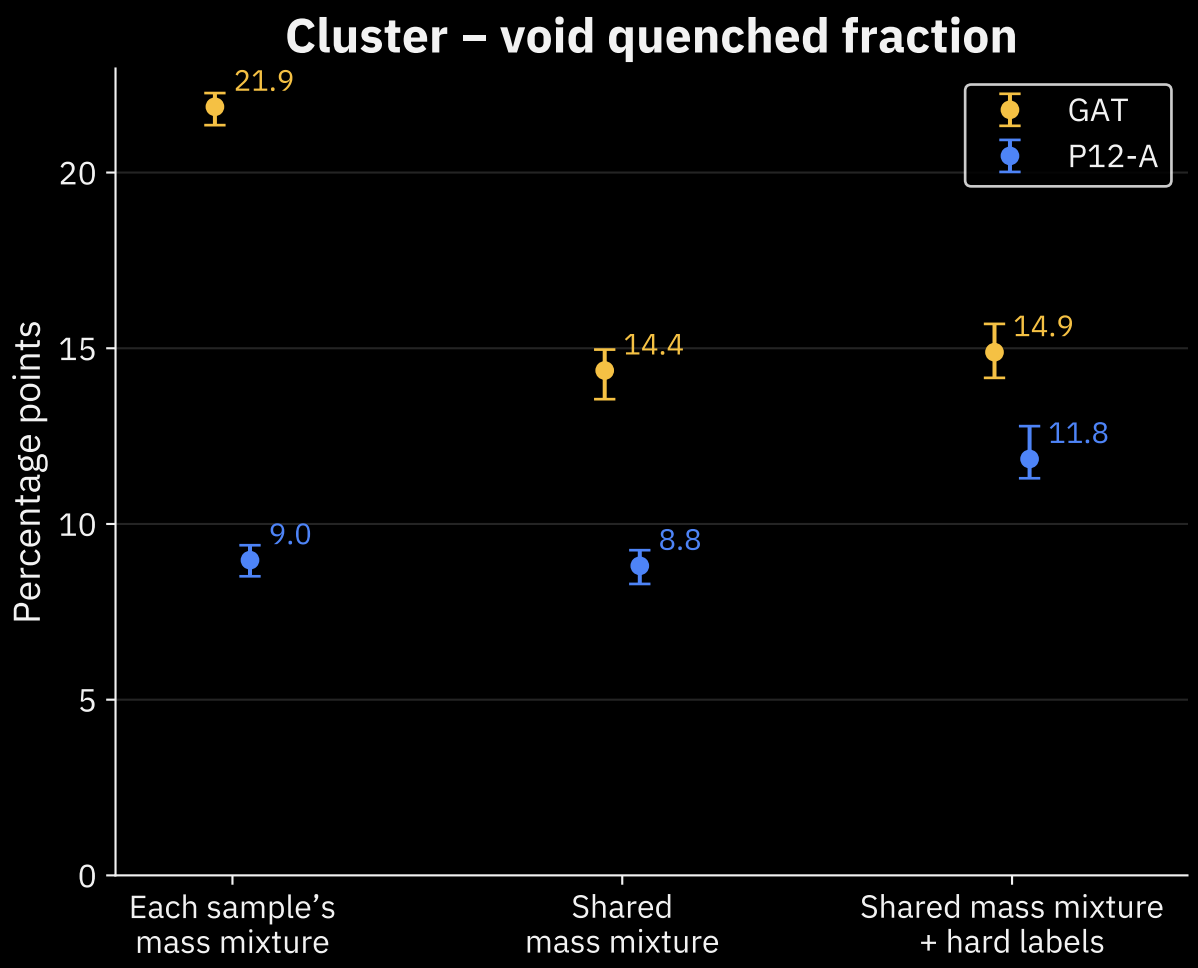
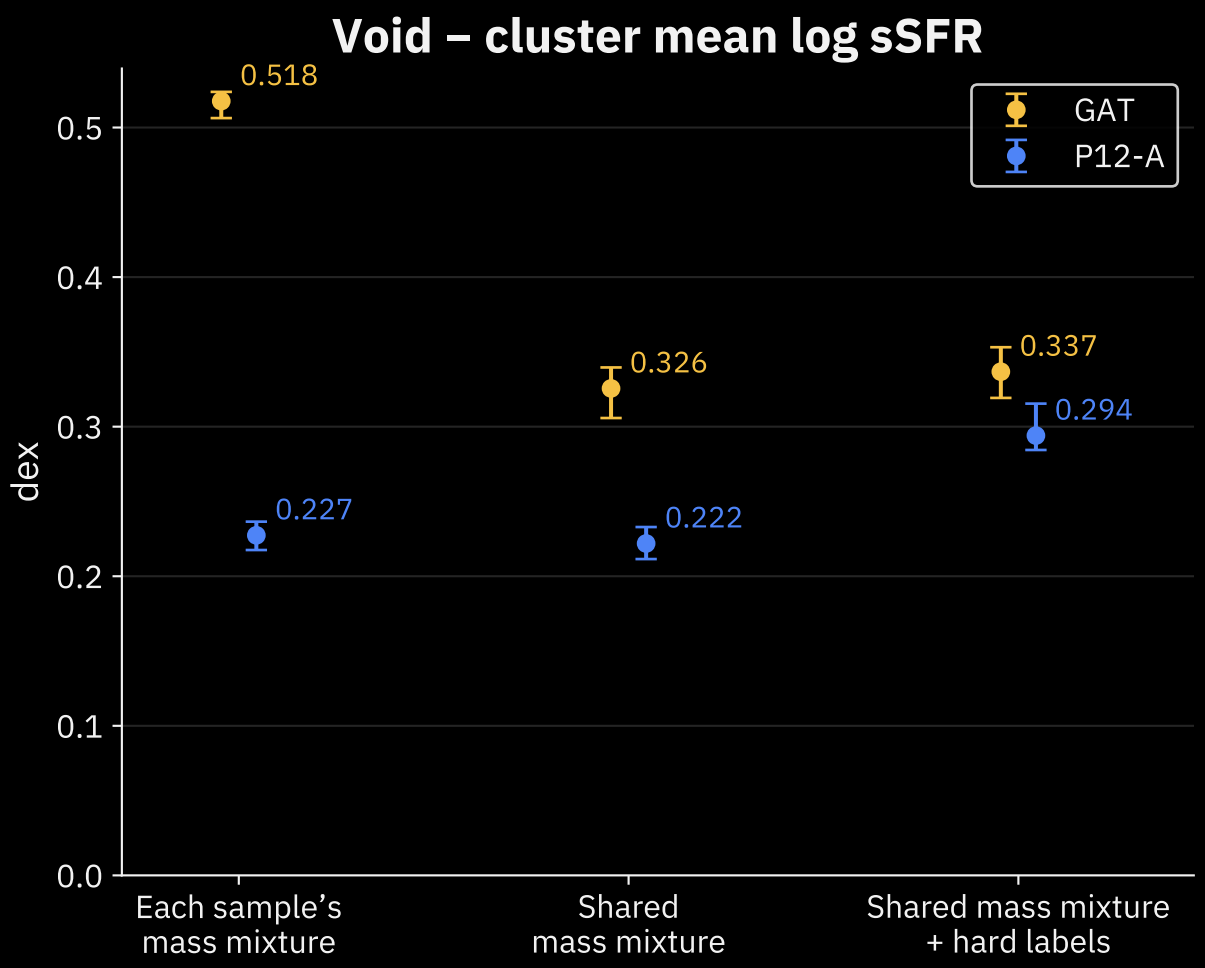
# Matching stellar mass and label treatment narrows the gap





All stages balance redshift within each sample. Shared mass: $10.2 \le \log_{10} M < 11.3$.
GAT z=0.01–0.06; P12-A z=0.20–0.30. Different samples remain; this is not a model-accuracy test.
Intervals: 16–84% sky-block resampling; stages change retained rows and weighting.
