
Selection-only experiment: TNG z = 0 placed at observing z = 0.20–0.30; r < 19.5; dust-free g/r photometry.
All curves use identical Loa weights in 0.25-dex mass × 0.01-redshift cells (≥80 rows in every arm).
TNG R7 truth versus Loa P12-A posterior-mean trace ranks; instantaneous versus CG15 SFR remains unmatched.
Shading: conditional 95% spatial bootstrap; repeated TNG placements share the same cube resampling.
