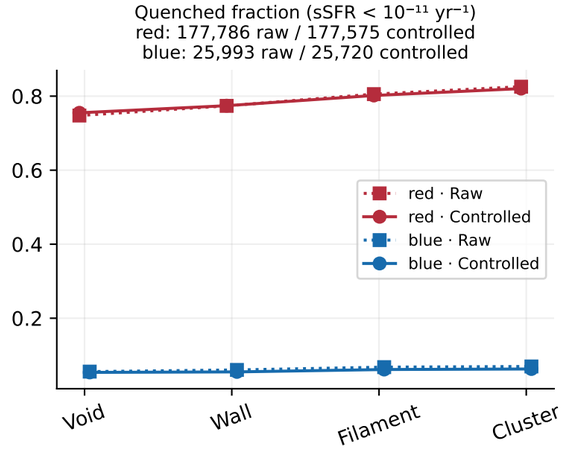
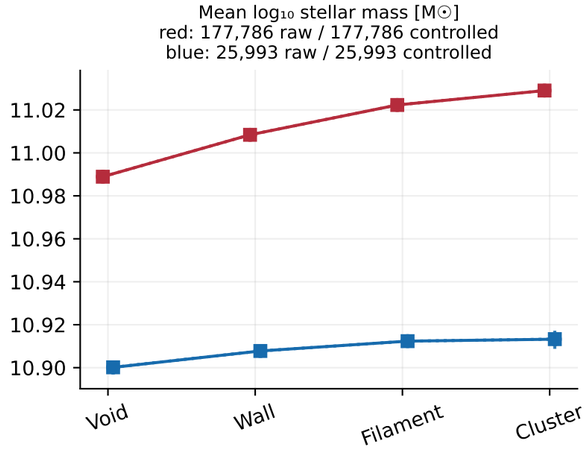
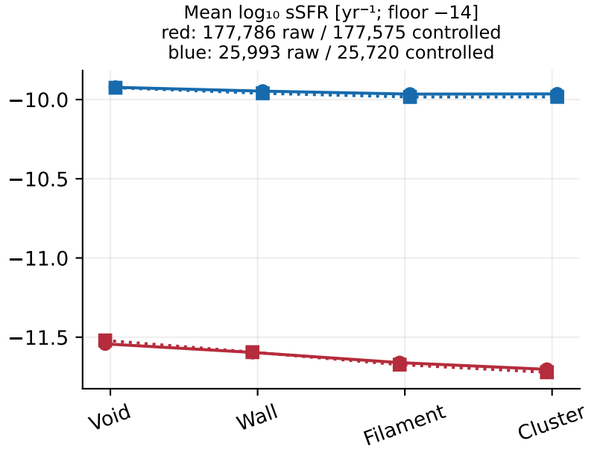
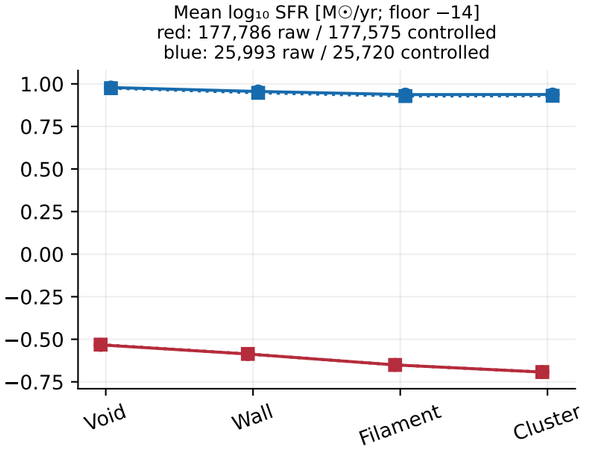
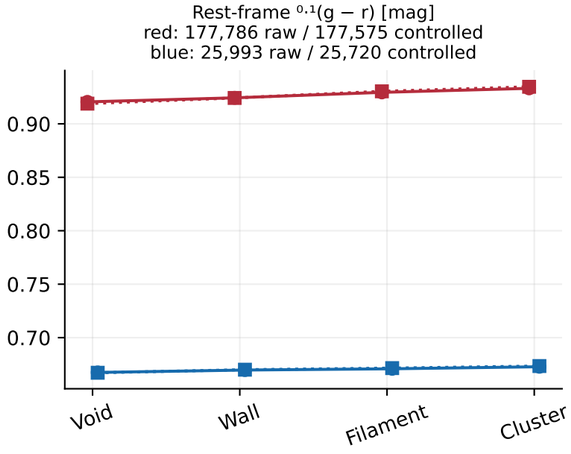
Rest-frame SDSS $^{0.1}(g-r)$ · $0.20 \le z < 0.22$ · $\log_{10} M_\star \ge 10.74$
Same-galaxy observed/rest comparison · red: 0.75 < colour < 1.5; blue: colour < 0.75
Solid: within-colour mass/z control (mass panel: z only); dotted: raw · conditional 95% sky-block intervals

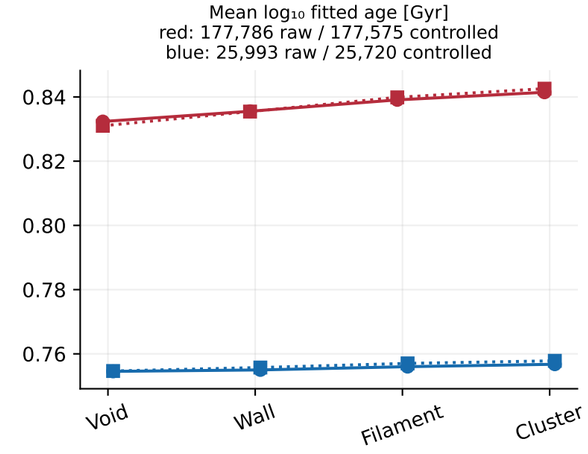


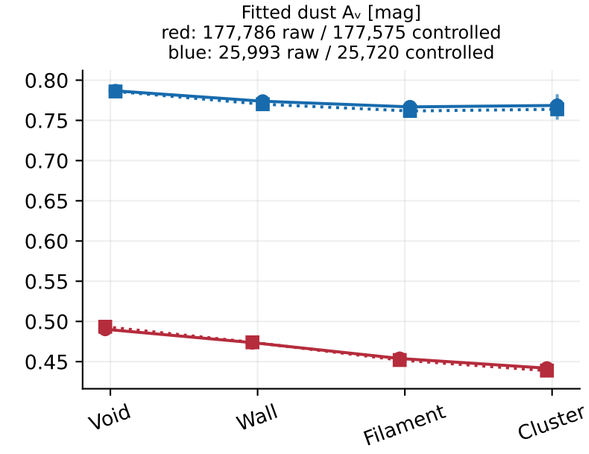


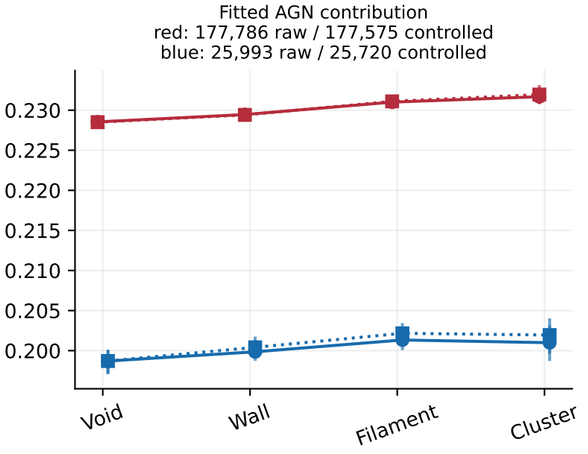












Inferred environment probabilities; red/blue curves have different support. Colour is not a quenching label. No causal or calibration claim.
